Research Abstract

Mild Cognitive Impairment is a transitional stage between normal aging and dementia. Individuals with MCI are likely to develop Alzheimer's disease at later stages in life. The main challenge is the to identify a biomarker that is inexpensive and less invasive. Lipid levels such as High-density lipoprotein cholesterol and low-density lipoprotein cholesterol could prove to be helpful in identifying MCI in the earlier stages. Studies aimed at finding less expensive biomarkers could lead to development of pharmacological and non-pharmacological interventions.

Fellowships: Govt/Non-Govt: None

Awards & Scholarships

None so far, trying to get better every day.

Way Forward:

My interest is to get into epidemiological studies, and probably clinical trials. A post-doc would be a dream come true. I feel that until then, I would say its unfinished business.
